TCBOA2.DOC

#### 1.0 INTRODUCTION

Dames and Moore is pleased to submit this report which presents the results and conclusions of a phased site characterization and subsequent remedial activities at the Bank of America property located at 4359 State Street, Ontario, California (Figure 1). This report contains a chronological summary of previous work conducted at the subject site and includes the results and conclusion of our final phase of work.

The property is located in an industrial/commercial area, approximately 600 feet west of Ramona Avenue and is rectangular in shape (415 feet by 200 feet). The outline of the property and the approximate location of the buildings, structures, and other features are shown on Figure 2. A detailed discussion of the hydrogeolgic conditions beneath the site is presented in Appendix A.

A review of selected records maintained by the Montclair Fire Department was conducted by Dames & Moore personnel and indicated that various machine and tool companies occupied the site from 1959 through 1983 (Table I). The most recent occupant, . SCME&E (1976 to 1987), manufactured truck bumpers and roll bars (Montclair Fire Department, 1987).

-1-

#### 2.0 PREVIOUS DAMES & MOORE SITE ACTIVITIES

## 2.1 PRELIMINARY SITE RECONNAISSANCE AND SUPPLEMENTAL SITE INVESTIGATIONS, APRIL THROUGH JULY 1987

Initially a preliminary site reconnaissance of the subject property was conducted on March 31, 1987. The purpose of the reconnaissance was to observe and document readily apparent features which would suggest that the property had been affected by the current or historic use of potentially hazardous materials. The results of the reconnaissance were presented in a letter to Bank of America dated April 8, 1987 (Appendix B).

In summary, the areas of concern observed onsite included:

- o An underground fuel storage tank (UST);
- o Numerous 55-gallon drums containing liquids;
- o Several sumps and/or machine pits;
- o Electrical transformers;
- o Subsurface pipelines, and
- o Areas of visibly stained or discolored surface soil.

In response to the findings of the reconnaissance, a supplemental site investigation was conducted to further evaluate the potential for the presence of hazardous substances associated with those areas listed above. The scope of services conducted and results of the supplemental investigation are presented in Dames & Moore's report dated July 27, 1987 (Appendix B).

-2-

In summary, the following findings were reported:

- The UST was not on record as being registered with the appropriate agencies and was not in compliance with current regulatory standards;
- o The drums in and near Buildings 2, 3 and 4 and two sumps/machine pits were sampled. Five drums were found to contain corrosive or ignitable materials. Fifteen drums and two sumps were observed to contain oil, based on visual inspection. Two drums, could not be opened for sampling during this investigation;
- o Stained soil was observed beneath drum storage areas;
- o The transformer was not sampled pursuant to discussions with Southern California Edison (SCE), owner of the transformer. According to SCE the transformer most likely has already been sampled, and contains less than 50 ppm PCB (Rich Dubois, SCE-personnel communications);
- o The hydraulic car lift showed no evidence of oil leakage, and
- Discussions with Bank of America personnel familiar with former site use indicated the sumps were actually machine pits inside which, hydraulic press machinery operated.

Based on the results of the supplementary site investigation, Dames & Moore recommended that: 1) The UST either be

-3-

brought into compliance or removed in accordance with the San Bernardino County Department of Environmental Health Services (SBCDEHS) Standards for the Underground Storage of Hazardous Substances, July 1, 1987; 2) The drums behind building 3 be removed and the remaining drums on site be sampled and categorized for appropriate removal; and 3) Soil sampling and chemical testing be conducted in the drum storage areas following characterization and removal of the drummed contents.

## 2.2 DRUM REMOVAL AND TANK EXCAVATION, MAY 1988

#### 2.2.1 PURPOSE AND SCOPE

Pursuant to the findings of the previous investigations the purpose of the next phase of the project was to: 1) characterize and remove the remaining drums containing hazardous waste located at the site; and 2) excavate and remove the UST. To meet these objectives, the following scope of services was completed:

- Sampled, chemically analyzed, categorized, and removed the remaining storage containers previously identified to contain hazardous substances; and
- Excavated and removed the UST according to SBCDEHS standards.

## 2.2.2 STORAGE CONTAINER REMOVAL

Initial drum sampling and characterization was conducted by Waste Control Services, a DHS certified hazardous waste

-4-

transporter. Drums that had been sampled in the previous investigation were removed from the site under manifest. A copy of the manifests is included in Appendix E. Following waste classification of the remaining drummed contents, Waste Control Services transported the waste to the appropriate facilities. drums containing hydrochloric acid were Four 55-gallon manifested and transported to the Casmalia Resources disposal facility in Casmalia, California. Seventeen 55-gallon drums containing waste-oil and water were transferred into a 2,000gallon tanker truck, manifested, and transported to the Petroleum Recycler Corporation (PRC) disposal facility in Signal The remaining dry drums were crushed, Hill, California. manifested, and transported to Casmalia for disposal. Following removal of the drums, the exposed soil in the drum storage area was surveyed to document the presence of soil staining. Those areas suspected to have been impacted by drum storage operations were targeted for future sampling and chemical characterization.

#### 2.2.3 UST EXCAVATION MAY, 1988

The 1,000 gallon underground storage tank was excavated and removed from the site in May 1988 (Figure 3). Following removal, two soil samples (Samples 1 and 2) were collected from beneath the underground storage tank at depths of 8 and 11 feet bgs, respectively (Figure 3). In addition, Sample 3 was collected from the excavated soil stockpiled onsite. Samples 2 and 3 were analyzed for total fuel hydrocarbons (TFH) using modified EPA

-5-

Method 8015 and for volatile aromatics using EPA method 8020. TFH concentrations were below detectable levels in both samples. No volatile organics were detected in Sample 3; however, Sample 2 contained toluene, ethylbenzene, and total xylene at concentrations of 0.0095, parts per million (ppm) 0.0086 ppm, and 0.122 ppm, respectively. Laboratory reports, and chain-ofcustody records are included in Appendix C. Tank disposal documentation are included in Appendix E. Following receipt of the chemical test results, the excavation was approved for backfill by SBCDHS (Ron Ripley, personnel communication).

## 2.2.4 SUMMARY AND CONCLUSIONS

Based on the results of this phase of the project, all of the drums were removed from the property. The contents of each drum was characterized and either; 1) transported to Casmalia Resources landfill under a hazardous waste manifest for disposal; or 2) transported to Petroleum Recycler Corporation under hazardous waste manifest for recycling.

Areas of obviously stained surface soils were located beneath the former drum storage areas and targeted for future characterization. The UST was excavated, removed, and the excavation subsequently backfilled under approval of SBCDHS.

Sampling and chemical testing was recommended by Dames & Moore to evaluate the condition of the soil in the obviously stained areas and beneath the concrete bottoms of the machine pits.

-6-

## 2.3 SOIL EXCAVATION, MACHINE PITS, AND TRENCH CHARACTERIZATION, AUGUST AND DECEMBER, 1988

## 2.3.1 PURPOSE AND SCOPE

To evaluate the nature and extent of stained surface soil, where evident, i.e., near the former 55-gallon drums and other containers, and below the machine pits, Dames & Moore conducted the following tasks:

- o Sampled and chemically tested stained surface soils;
- Excavated stained areas with a backhoe and obtained confirmatory soil samples;
- o Cored the base of the machine pits and obtained soil samples with a hand auger;
- o Chemically tested the soil samples;

#### 2.3.2 SOIL SAMPLING AND CHEMICAL TESTING

A total of ten soil samples were collected in August 1988 from the stained areas (Figure 4). Surface soil samples were collected from the upper 12 inches of obviously stained soil using a soil scoop. The soil sample was placed in a laboratoryprepared glass jars and sealed with a Teflon-lined lid. The jars were cooled in the field on blue ice through shipment to the laboratory. Soil sampling scoops were cleaned between each sample using a tri-sodium phosphate solution, rinsed in distilled water, and dried.

Soil samples were collected from the bottom of the machine pits by coring through the concrete base, and advancing shallow

-7-

hand augered borings to depth of 2 feet. Disturbed soil samples were collected from the hand auger and firmly packed into laboratory prepared glass jars. The jars were sealed and stored in a cooler with blue ice in the field and through shipment to the laboratory. (Figure 4 samples B2W, B2E, B4W, B4E, and 9).

Soil samples were submitted to West Coast Analytical Services of Santa Fe Springs, California, a California Department of Health Services (DHS) approved laboratory. Selected surface soil samples were analyzed for: 1) volatile organic compounds using EPA Method 8240, 2), TFH using EPA Method 8015 modified, and 3) total petroleum hydrocarbons (TPH) using EPA Method 418.1. Samples collected from below the base of the machine pits were chemically tested for TPH using EPA Method 418.1. Sample 9 was tested for semi-volatile organic compounds using EPA Method 8270 and California Code of Regulations Title 22 (Title 22) metals using ICPMS methods.

Results of TFH and TPH laboratory analyses are presented in Tables II and III (8/23/88), respectively. Complete laboratory reports are provided in Appendix C. Laboratory results indicated that heavy-end hydrocarbons (C-10 to C-30 range) were present in the stained surface soil samples 1A, 2B, 4A, 5A, 6A, and 7A at concentrations greater than 5,000 ppm. Of the two samples tested for volatile organic compounds, sample 1A had an acetone concentration of 0.130 ppm and Sample 4A had detectable

-8-

concentrations of acetone (0.230 ppm), 2-butanone (0.160 ppm), 2-hexanone (0.120 ppm), and toluene (0.013 ppm).

Laboratory results of the samples collected from beneath the machine pits indicated that TPH was present at a concentration of 43,000 ppm at the west end of the machine pit in Building 2 (Sample B2W) and 330 ppm on the east end of the same pit (Sample B2E). TPH concentrations in the sample collected from the western most machine pit in Building 3 was 41,000 ppm (Sample B4W) and not detectable in the eastern most pit (Sample B4E, Table III).

## 2.3.3 STAINED SURFACE SOIL EXCAVATION

Stained surface soil areas with TFH and TPH concentrations greater than 1000 ppm were staked in the field prior to excavation. These locations are presented on Figure 4. Soil excavation was conducted by Chamberlain Backhoe Service, a subcontractor licensed to handle hazardous materials. The excavation activities were observed and documented by Dames & Moore field personnel. During excavation, the exposed soil was periodically monitored for organic vapor emissions using an organic vapor analyzer (OVA). Excavation in each area continued until the obviously stained soil was removed and the OVA readings of the exposed soil were at ambient levels.

The excavated soil was transported by Casmalia Resources Transportation and disposed at Casmalia Resources Landfill. A

-9-

total of approximately 40 cubic yards of soil was removed from the site. Appropriate documentation is included in Appendix E.

Following excavation, confirmation soil samples were collected on November 18, 1988 from the base of the excavations in 3-inch long, 2-1/2 inch diameter stainless steel sleeves. These samples were packaged for shipment to the analytical laboratory by covering the soil exposed at the ends of the sleeves with Teflon sheeting, fitting each end with plastic end caps, and sealing the caps to the sleeve with vinyl tape. Samples were then labeled with the following information: boring number, depth of sample, sample number, date of collection, collector's initials, owner, location, and time of collection. Sealed and labeled samples were stored in coolers with blue ice until delivery to the laboratory. Completed chainof-custody records accompanied the samples.

Soil samples were submitted to West Coast Analytical Services. The samples were tested for (TPH) and (TFH) by EPA Methods 418.1 and 8015, modified, respectively.

The laboratory test results of the confirmation samples indicated that TPH concentrations were less than 40 parts per million (ppm) and TFH concentractions were below detectable levels. A summary of the results is presented in Tables II, and III (11/18/88).

#### 2.3.4 SUMMARY AND CONCLUSIONS

As the result of activities conducted during this phase of the project, approximately 40 cubic yards of the surface stained

+10-

soil was excavated to depths ranging from 4 to 7 feet bgs in December 1988. This soil was manifested, and transported to an appropriate disposal facility. Confirmation samples indicated that excavation operations have effectively removed the soils containing elevated concentrations of petroleum hydrocarbons from the stained areas.

The laboratory test results from below the machine pits in Buildings 2 and 3 indicated that elevated TPH concentrations are present in the soil immediately beneath the machine pits. The volume of soils impacted by petroleum hydrocarbons is not fully known but appears to be limited to the area directly beneath the former machine pit areas in Buildings 2 and 3.

# 2.4 <u>MACHINE PIT CHARACTERIZATION MARCH 1989</u> 2.4.1 <u>PURPOSE AND SCOPE</u>

The purpose of this final phase of the project was to: 1) evaluate the lateral and vertical extent of hydrocarbon impacted soils beneath the former machine pits in Buildings 2 and 3; and 2) to evaluate the nature of water contained in a subsurface drain structure located in the northeast corner of the site near Building 6 (Figure 5). To meet this objective, the following tasks were completed:

 Drilled a hollow stem auger boring adjacent to the western pit in Building 3;

-11-

- Drilled a hollow stem auger boring adjacent to the pit in Building 2;
- O Chemically tested selected soil samples collected from the borings;
- o Sampled and chemically tested standing water from the subsurface drain, and
- o Reviewed laboratory and field data.

#### 2.4.2 FIELD METHODS

Two hollow stem auger borings, Boring B1 and Boring B2, were drilled adjacent to the machine pits at the locations presented in Figure 5.

Boring B1 was drilled immediately adjacent to the western most machine pit in Building 3, and B2 was drilled approximately 2 feet from the western end of the machine pit in Building 2. The borings were drilled to a maximum depth of approximately 30 feet below ground surface (bgs) with a truck-mounted drill rig equipped with 6-inch diameter hollow stem auger.

A continuous log of soils encountered during drilling was maintained by the geologist for each boring. A log of borings is presented in Appendix F. Relatively undisturbed soil samples were collected during the drilling at approximately 5-foot intervals using a Dames & Moore U-type soil sampler. Soil samples were collected for laboratory analyses to assess the TPH concentration of the soils in the vicinity of the machine pits. Soils were classified in accordance with Unified Soil

-12-

Classification System. The samples were collected in 3-inch long, 2-1/2 inch diameter stainless steel sleeves. After the sampler was retrieved from the borehole, each soil sample was screened for the presence of organic gases using an OVA.

Selected soil samples were packaged for shipment to the analytical laboratory by covering the soil exposed at the ends of the sleeves with Teflon sheeting, fitting each end with plastic end caps, and sealing the caps to the sleeve with vinyl tape. Samples were then labeled with the following information: Boring number, depth of sample, sample number, date of collection, collector's initials, owner, location, and time of collection. Sealed and labeled samples were chilled in ice chests until delivery to the laboratory under chain-of-custody documentation.

Down-hole equipment was steam cleaned before drilling of each boring. Prior to soil sampling, samplers were washed in a dilute trisodium phosphate (TSP) solution, rinsed in fresh and distilled water, and dried.

Soil borings were backfilled with a cement-sand slurry. Soil cuttings were left onsite in labeled DOT approved 55-gallon drums.

One sample was collected from the standing water in the drainage vault located in the northeast corner of the property near Building 6 (Figure 5). The water sample was drawn directly from the vault into a 40 millileter vial and sealed with a Teflon

-13-

septum-lined cap. The sample was submitted for chemical testing of TPH by EPA 418.1 and volatile organic compounds by EPA 624.

## 2.4.3 LABORATORY TESTING

Soil samples were selected from both borings at depths of 10 and 25 feet bgs for analysis of TPH according to EPA method 418.1 and at 10 feet bgs for analysis of volatile aromatic organic compounds according to EPA method 8020. The water sample was chemically tested for TPH by EPA Method 418.1 and for volatile organic compounds by EPA Method 624.

## 2.4.4 FIELD RESULTS

Soil encountered in borings B1 and B2 were predominantly light-to medium-brown fine silty sands and sandy silts. A fine gravel lense was encountered in both borings between the depths of 24 and 28 feet bgs. Although the soils were generally damp, ground water was not encountered during the course of this subsurface investigation.

No discolored soils or detectable concentrations of organic vapors were encountered in either of the borings. Hydrocarbon odors were not detected by the OVA during drilling.

## 2.4.5 LABORATORY RESULTS

The chemical test results are summarized in Table IV and complete laboratory reports included in Appendix D. The two

-14-

samples tested from boring B1 contained 30 ppm and 20 ppm TPH at 10 and 25 feet bgs, respectively. No detectable concentrations of benzene, toluene, xylene or ethylbenzene were reported by the laboratory in the soils at 10 feet bgs in this boring.

The two samples tested from boring B2 contained 20 ppm TPH at both 10 and 25 feet bgs and concentrations of 0.011 ppm Toluene, 0.032 ppm Xylene, and 0.006 ppm Ethylbenzene in the 10 foot sample. Results of the water sample chemical testing indicated that no petroleum hydrocarbons (as reported in EPA Method 418.1) or volatile organic compounds are present in the standing water.

#### 2.4.6 CONCLUSIONS

Based on the results of the machine pit characterization investigation, the following were concluded:

- The water standing in the subsurface drainage vault does not appear to contain hazardous compounds;
- Detectable concentrations of petroleum hydrocarbons are present beneath the two machine pits, as indicated by the December, 1988 investigation;
- o The subsurface soils immediately adjacent to the machine pits and to a depth of 25 feet bgs do not appear to be impacted by petroleum hydrocarbons, as indicated by

-15-

the laboratory analyses of selected soil samples from Borings B-1 and B-2 (Table IV). TPH concentrations were reported at 30 ppm or less and volatile aromatic compounds were below 1.0 ppm in the soils tested for these compounds.

- The hydrocarbons detected in the soils beneath the machine pits appear to contain predominantly heavy end petroleum hydrocarbons; and
- o Based on the hydrogeologic conditions of the subject site (**accound water** expected to be greater than 300 feet bgs, Appendix A), the heavy-end petroleum hydrocarbons are relatively immobile and will likely not migrate 300 feet through the vadose zone to impact ground water.

## 3.0 SUMMARY OF CURRENT SITE CONDITIONS

The site is located on a low relief alluvial plain in the western portion of the Chino Hydrogeologic Basin. Ground water is estimated to be present at depths greater than 300 feet bgs. Soils encountered just below grade on the site are predominantly fine grained silty sands assumed to have a relatively low permeability.

Preliminary site work involved removal of drums from the site, excavation and removal of a 1000-gallon UST, character-

-16-

ization of potentially affected soils, and the removal and disposal of surface stained soils. Subsequent work involved further assessment of subsurface soils impacted by potentially hazardous materials beneath the machine pits and standing water in a subsurface drain structure.

Two small areas of hydrocarbon impacted soils remain in situ, one beneath the western machine pit in Building 3 and the other beneath the western end of the machine pit in Building 2 (Figure 5). Based on results from the laboratory testing, these hydrocarbons contain a predominance of heavy end fractions indicative of relatively non-volatile and immobile hydrocarbons and appear to be present directly beneath the base of the two machine pits in very limited extent.

#### 4.0 PROPOSED ACTION

It is our understanding that the Bank of America intends to fill the machine pits with sand or gravel and finish to grade with a 12 inch thick concrete seal. It is our opinion that backfilling the pits and sealing them with a concrete cap is an acceptable and appropriate action based on site conditions, for the following reasons:

- The petroleum hydrocarbons are heavy-end, relatively immobile compounds present in a localized area directly beneath the machine pit floor;
- o Ground water is at a depth approximately 300 feet below the detected compounds (Appendix A);

-17-

- The source of the petroleum hydrocarbons (hydraulic machinery ) have been removed;
- The concrete cap will prevent surface water from percolating through and mobilizing the petroleum hydrocarbons; and
- The petroleum hydrocarbon concentration will gradually attenuate over time through the natural decomposition by biological organisms in the soil.

-000-

We trust this report meets your needs. Should you have any questions, please contact us.

Respectfully submitted,

DAMES & MOORE

GEOLOGIC AND HYDROGEOLOGIC SETTING

#### GEOLOGIC AND HYDROGEOLOGIC OVERVIEW

The site is located at an elevation of approximately 920 feet above mean sea level, and the local topography slopes gently toward the south-southwest. The region and the site area is underlain by Recent Alluvium (Bortugno and Spittler, 1986).

The site is located in the western portion of the Chino Basin, one of four major sub-basins in the Upper Santa Ana Valley hydrologic basin. The Chino Basin is a low relief alluvial plain encompassing approximately 300 square miles in the central and western portions of the Upper Santa Ana River Valley (California Department of Water Resources, 1959).

The water-bearing sediments in the Chino Basin are divided into younger and older alluvium (Dutcher and Garrett, 1963). The younger alluvium consists primarily of gravel, sand, silt, and clay (Dutcher and Garrett, 1963).

The older alluvium provides the majority of ground water in the Chino Basin and is composed primarily of interbedded deposits of gravel, sand, silt, and clay with variable amounts of cobbles and boulders. The older alluvium can be subdivided into finer alluvial-fan deposits and coarser fluvial deposits which grade from one to another through a series of overlapping wedge-shaped layers (Geotechnical Consultants, Inc., 1980).

Ground water in the Chino Basin generally occurs as an unconfined aquifer located several hundred feet below ground surface (bgs). An exception to this is in the far western

-1-

portion of the Chino Basin, adjacent to the Puente Hills and Chino Fault, where semi-confined ground-water conditions exist (Metcalf and Eddy: L.D. King, 1981). Ground-water flow in the western portion of the Chino Basin is principally toward the south-southeast with local variations in flow direction.

Two ground water wells with water elevation data are located within one mile of the site (Table A-I). Based on a review of this information, depth to ground water in the site area is inferred to be greater than 300 feet bgs with a gradient to the south-southeast (Carson and Matti, 1985).

SANTA BARBARA

Subject: Preliminary Site Reconnaissance, 4359 State Street, Ontario, California

Reference(s):

#### INTRODUCTION

In accordance with the agreement between the Bank of America and Dames & Moore dated 24 March 1987, I conducted a preliminary site reconnaissance of the property at 4359 State Street in Ontario, California for the purpose of observing readily apparent features which could suggest that the property had been affected by the current or historic use of potentially hazardous materials. I contacted two local regulatory agencies to ask whether they had any relevant files on, or knowledge of environmental concerns at, the property. There was no opportunity to interview onsite personnel because the property had been vacated. My site reconnaissance and recommendations for followup activities are summarized below. This summary is based on my onsite observations, and limited conversations with personnel from two regulatory agencies. No samples were collected, and no representation of site conditions beyond that specifically stated is expressed or implied.

#### SITE DESCRIPTION AND BACKGROUND

The property is located at 4359 State Street in Ontario, California, within San Bernardino County. The property is located in an industrial/ commercial area, approximately 600 feet west of Ramona Avenue.

The property is bounded by State Street on the north, a swap meet building on the east, a "Shops for Rent" complex which includes RA Insulation, Spotswood & Son Precision Machine, Redco Grinding and Hoagys Leather Specialties on the west, and a house and undetermined buildings on the south.

The property is rectangular (415 feet by 200 feet), with a dogleg at the southwest corner. Figure 1 shows the outline of the property and the approximate locations of the buildings, structures and other features. For purposes of this report, the buildings are numbered according to the sequence of review. There is a fence running north-south through the middle of the property. Figure 1 was drawn from sketches made during the site reconnaissance and is not intended to be a plot plan. Access to the property is restricted by fencing, locked gates, and the position of neighboring buildings.

Information on the historic use of the property was not available. According to Mr. Lloyd Gardner, Bank of America, the last occupant on the western portion of the property made aucomobile rollbars. This was confirmed during the site reconnaissance.

#### SITE RECONNAISSANCE

The site reconnaissance was conducted on 31 March 1987, between 0815 and 1330 hours. A guard from Liddle Patrol provided access to all areas, except that two doors on the outside of Building 1 could not be opened. The electricity was off; there was no lighting in the interior of the buildings, except for sunlight through opened doors and openings in the walls.

#### Outside Area West of Building One

The ground west of Building One is mostly covered by a large concrete pad. Writing in the concrete noted "ROQ, 8-10-82". There is a small sump running the length of the northern edge of the concrete pad, which bottoms in soil. The concrete pad abutts concrete mason blocks on the western edge of the property. These concrete mason blocks have holes in them which bottom in the soil. On the concrete pad are two cars, two forklifts, a truck, some fiberglass molds or pieces, some pipe, some tubing and some steel plate.

The northwest portion of Building One is cut back, with a concrete wall forming an enclosure with dirt and vegetation. There are three electrical transformers on a poled platform immediately above this enclosure. There were no markings on the poles or transformer visible from the ground which would indicate the presence or absence of polychlorinated biphenyls (PCBs). The poles had some dark staining on them.

#### Ourside Area South of Building One

The ground south of Building One is covered by a concrete pad which extends to approximately 10 feet from the southern edge of the property. This area to the property boundary contains dirt, weeds, some metal and debris.

#### Building One

Building One is a block building containing offices. The electricity was off and visual observation of most of the building was not possible.

#### Area Between Building One and Two

There is a dirt area approximately 1 foot wide between Buildings One and Two. A roof common to both buildings covers the area, and visual observation of the area was not possible. Building Two extends approximately 12 feet south of Building One. Next to Building Two is a trench approximately 1 foot by 12 feet. There are pipes in the trench; one pipe from Building Two disappears into the bottom of the trench. The trench bottom is discolored a dark black.

#### Building Two

Building Two is a steel frame building with siding and a concrete floor. There were various pieces of pipe, tools and metal throughout the building. The building contained large equipment (presses, punches, etc.). Most of the equipment was sitting on the concrete floor.

One piece of equipment had a narrow, shallow sump beneath it, which bottoms in soil. The soil in the sump was dark stained. There was a large piece of equipment at the south end of the building set over a sump. The sump contained an oil-like fluid in it. The depth and construction of the sump is unknown. There were eight 55-gallon drums around the machine containing what appeared to be hydraulic oil.

#### Outside Area South of Building Two

The area south of Building Two contains a concrete pad which ends approximately 10 feet from the southern edge of the property. Next to the south side of Building Two on the concrete were four 55-gallon drums with unknown materials: 3 were mostly full, 1 appeared to be empty. There were also two 25-gallon (?) drums of sodium hydroxide and smaller cans of auto surface primer and other unknown materials next to Building Two. There were also of metal on the concrete pad.

There is a dirc area between the concrete pad and the southern property boundary which contained weeds. There were two 55-gallon drums with unknown material and two smaller drums with unknown material in this dirt area. There is a fence extending from Building Two to the southern property line.

### Outside Area Between Building Two and Buildings Three and Four

The area between Building Two and Buildings Three and Four contains a concrete pad which ends approximately 10 feet from the southern edge of the property. At the southern edge of the concrete pad is an open-sided roofed area, approximately 36 teet by 36 feet. In this roofed area were two small tables and some turned rollbars. At the southern edge of the roofed area there were six empty 55-gallon drums, and one 55-gallon drum containing an unknown liquid. At the eastern side of the roofed area, there was one empty 55-gallon drum of muriatic acid.

South of the concrete pad, the soil had a brown and rust-colored discoloration. There was no vegetation in this soil area. There were two 55-gallon grums containing unknown material on the soil.

Next to Building Two there were approximately 100 large silver-colored pan-like objects, some piles of metal and a large piece of equipment.

Next to Building Three is a concrete sump, which apparently has a dirt bottom. A gutter pipe from Building Three's root dumps into this sump. A dirt ditch runs from Building Two through the concrete pad and terminates at this sump; a pipe of unknown origin also terminates in this sump.

Next to Building Three and Four were piles of metal, some boards and some chrome-plated rollbars.

#### Outside Area South of Building Three

There was a hydrascrew machine at the outside southwest corner of Building Three. There was dark black discolored soil beneath the machine. There is a block enclosure area behind Building Three. There is apparently dirt in this enclosure which is covered with weeds. There were 62 stacked 55-gallon drums in this enclosure on top of the dirt. Some had open tops and were empty; however, most were not examined because they were stacked in pyramids. There was some discolored soil around the drums. There was an open 16 inch diameter pipe laying on its side in this enclosure. There was dark black discolored soil at the base of the steps which lead to the elevated enclosure.

#### Building Three

Building Three is a steel frame building with siding and a concrete floor. There were three large pieces of equipment, apparently presses, in the building. There was some metal on the floor, some piles of turned pipe, and one pile of straight pipe. There were two 55-gallon drums containing unknown material in Building Three.

#### Building Four

Building Four is a sceel frame building with siding and a concrete floor. This building contained drills, machining equipment, a lathe, sawes and benches. There were both straight and turned pipe in the building, as well as piles of metal. There were two 55-gallon drums of unknown material and smaller containers of unknown material in the building.

# Outside Area Between Buildings Three and Four and the Fence

There is a 6-foot-high metal picket fence running north-south across the property approximately 6 feet east of Buildings Three and Four.

East of Building Three there is a small sump, approximately 1 foot by 1 foot and 1 foot deep. The sump had water in it at the time of the reconnaissance, and there was mud on the bottom. The sump had a hard bottom, but it could not be determined if the bottom was concrete or dirt.

There was one, mostly full 55-gallon drum next to Building Three. Markings on the drum read "DTE Oil 25".

East of Building Four there is a 4-inch diameter hole in a rough concrete area, apparently going to soil. There was dark discolored soil in the hole, and less discolored stained soil near the hole.

There was an area of discolored soil at the northeast corner of Building Four.

#### Outside Area North of Building Four

The area north of Building Four contains a concrete pad. There is a concrete sump with a dirt bottom at the northwest corner of Building Four. Two pipelines of unknown origin terminate in the sump.

North of the west edge of Building Four, there were two 55-gallon drums. One drum was closed-topped and contained unknown material; the other drum was open-topped and was half full of a dark oily fluid.

Next to Building Four, there was one empty 55-gallon drum and one apparently full 55-gallon drum containing unknown material.

-----

There were three open-topped 55-gallon drums near the northeast corner of Building Four. One drum was empty, one drum was full of garbage, and one drum was full of garbage.

There were piles of metal and pipe along the edge of Building Four, and along the northern property boundary.

# Outside Area Between the Fence and Buildings Five and Six

Nost of the area between the fance and Buildings Five and Six is covered with concrete, except for the northern portion which is mostly covered with asphalt.

This area is approximately 4 feet higher in elevation than the area around Builds Three and Four. There are three concrete downramps leading from the concrete pad down to Buildings Three and Four. North of the northernmost downramp, there is a gasoline pump and fill box, indicating the probable presence of an underground storage tank. There is dirt (not asphalt paving) in the pump area. There was some dark staining near the gasoline pump. There was also dark staining on the asphalt approximately 10 feet east of the pump.

There is a trench at the southern edge of the concrete pad that was filled with siding, pipe and debris. A 1-1/2 inch diameter plastic pipe exits Building Five (the pipe is cut and open inside Building Five), runs west along the trench, and opens into the trench after passing underneath the fence.

The asphalt near Building Six showed some dark staining. There were two 30-gallon drums of unknown material and one 5-gallon can with the label. "Flammable Liquid, Paint UN 1283" next to Building Six.

There is an east-west excavation through the asphalt near the northwest corner of Building Six. There is a brick sump structure at ground level at the eastern edge of the excavation. It had water in it during the reconnaissance and has a hard bottom. Neither the bottom construction nor the purpose of the sump could be determined.

There is a concrete capped, 4 foot diameter concrete sump approximately 2 feat below ground surface at the western edge of the excavation. The purpose of this sump is also unknown.

#### Building Five

Building Five is a steel frame building with siding and a concrete floor. The building was almost completely empty; there were some wood, tables and pallets along the west wall of the building.

#### Outside Area East of Building Five

There is a 3 inch diameter iron pipe in the ground next to Building Five. There were some used oil pans off the property, behind the swap meet building.

#### Building Six

Building Six is a block building with a wood roof and a concrete floor. There is a hydraulic car lift in the center of the floor; otherwise, the building was empty.

#### AGENCY CONTACTS

Inspector Denise Phaneuf of the Montclair Fire Department was contacted. The Montclair Fire Department has fire jurisdiction in the area, even though the property is just outside the Montclair City limits.

The fire department records show the following for 4359 State Street:

1959 - Dumas Machine & Tool Company.

1964 - A weed abatement complaint against Dumas.

- 1965 No tenant.
- 1967 Valley Metal Treating Company, there was a weed abatement and housekeeping problem during 1967.
- 1970 Master Deburring.
- 1971 Chin-Tario Machinery & Equipment.
- 1972 Comprehensive Sheet Metal.
- 1974 A permit for an aboveground LPG tank at 4363 State Street.
- 1976 CSM&E.
- 1982 A permit for an aboveground 499 gallon LPG tank.
- 1983 A permit for an aboveground 499 gallon LPG tank.

There were no records of underground storage tanks or environmental complaints in the fire department records.

Mr. Steve Van Stockun, San Bernardino County Department of Health Services was contacted to ascertain if there were any hazardous or toxic materials records concerning the property. Mr. Stockun stated that the records are not filed by address; rather they are filed by alphabet according to the occupant.

I provided Mr. Stockun with the names of the property occupants I had obtained from the fire department. None of the occupants appeared in the health department records. Mr. Stockun did note that the department has good files only from 1983. Mr. Stockun did check with other personnel in the department, and there was no recollection of any earlier files on the occupants or property.

#### DISCUSSION

The major areas of concern include:

- The underground fuel storage tank.
- The numerous drums on the property, including drums containing sodium hydroxide and muriatic acid which are hazardous wastes under California Administrative Code (CAC) Title 22, Chapter 30, Section 66680.
- The various sumps.
- The possibility of PCBs in the transformers on the poled platform.
- The presence of various pipelines.
- Soil staining in various areas of the property.

Another concern is that fact that the facility may have chrome-placed some of the rollbars. A chrome plating bath was not located; however, the presence of chrome finished bars suggests that chromium plating may have occurred on site. The possibility exists that improper handling of chromium plating solutions or paints could have caused onsite chromium contamination.

It is difficult to assess the significance of the pipelines, the sumps, and to some extent the soil stains without knowing more about the past activities at the site, including the location and purpose of all pipelines and the inflows and outflows (piping, seepage, evaporation, etc.) at all sumps.

The lack of vegetation in the stained soil area south of the open air roofed area is of concern. The depth of soil staining throughout the property was not evaluated during the site reconnaissance.

If hazardous materials or wastes were placed in the sumps, and the sumps are determined to be surface impoundments, the sumps could be subject to the requirements of the Toxic Pits Cleanup Act. Alternately, they may be considered underground tanks. However, such a determination cannot be made without knowing the purpose and inflows to the sumps.

The majority of the drums on the property had no label or marking to indicate contents. However, at least three drums contained hazardous waste under CAC Title 22 Section 66680. The hazardous status of the other drums could not be determined.

There was no visual indication from ground level regarding whether or not the transformers on the poled platform were labelled for PCBs. The hazardous status of these transformers could not be determined.

The apparent pouring of the concrete pad west of Building One in 1982 would indicate that some of the pads may have been poured after the facility was in operation. Without a knowledge of past activities and construction plans, it is not possible to ascertain if soll contamination could exist beneath the concrete pads.

The property is located in an industrial/commercial area, with other facilities which could contribute to soil and ground water contamination in the area. If contamination is detected at the property, particularly ground water contamination, the possibility exists that the contamination may have come from off-site sources.

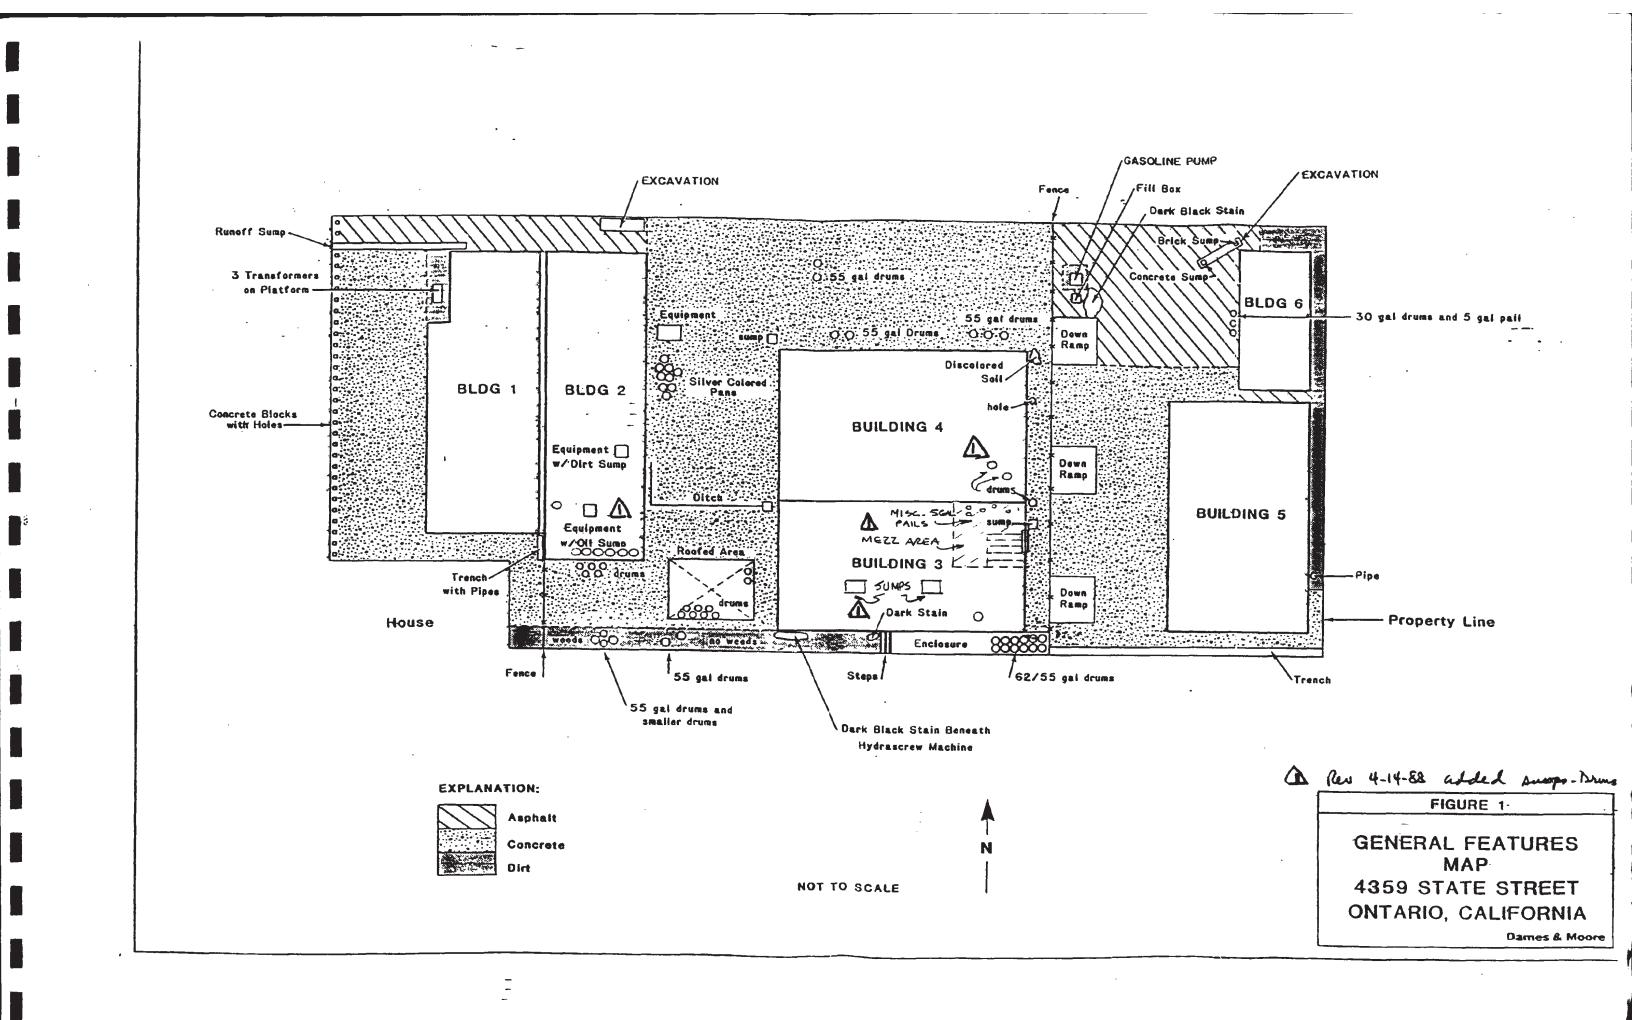

#### RECOMMENDATIONS

Based on the preliminary site reconnaissance, I recommend the following actions:

- 1. Plot plans and construction drawings of all pipelines, sumps and process equipment should be obtained and reviewed, if possible. Previous occupants should be interviewed, if possible, to determine what activities occurred at the property and what materials were used.
- 2. The Bank should determine whether or not the underground storage tank has been properly registered with the California Water Resources Control Board. If not, the tank should be registered. The Bank must determine whether to retain or remove the tanks and take appropriate steps to comply with the regulations for underground storage tanks.

If the Bank decides to remove the tank, soil samples should be taken during excavation to determine if the tank leaked, causing soil contamination.

- 3. The drums of sodium nydrowade and muristic acid should be properly disposed of as hazardous waste. The other drums on the property should be sampled to determine contents. All the drums should be disposed of properly.
- 4. Soil stains should be sampled to determine the type and extent of contamination. Particular attention should be given to the following areas:
  - The dark stained dirt soil in the sump in Building Two
  - The crench between Buildings One and Two
  - The brown and rust-colored area without vegetation, south of the open-air roofed area
  - The stained soil at the base of the enclosure stairs, south of Building Three
  - The stained soil near the 62 bacrels in the enclosure, south of Building Three
  - The stained soil around the hydrascrew machine at the southwest corner of Building Three
  - The discolored soil at the northeast corner of Building Four
  - The dark stained soil near the gasoline pump
  - The stained soil in and near the hole east of Building Four
- 5. Depending on the results of the plan reviews and interviews, the sumps should be sampled to determine the type and extent of contamination, if any.
- 6. Transformer records should be reviewed to see if PCB content has been determined. If no records exist, the transformers should be sampled to determine PCB content.
- 7. The hydraulic car lift in Building Six should be raised to determine if subsurface leakage of hydraulic fluid has occurred.

SUPPLEMENTAL SITE INVESTIGATION 4359 STATE STREET ONTARIO, CALIFORNIA

DAMES & MOORE JOB NUMBER 02733-036-044 JULY 27, 1987

112.2/3-COV

July 24, 1987

Mr. James Ochsner Residential OREO Sales Group, #3361 Bank of America Post Office Box 37000 San Francisco, CA 94137

> Supplemental Site Investigation 4359 State Street Ontario, California

Dear Mr. Ochsner:

Enclosed is a report which summarizes the results of our supplemental site investigations at the above-referenced property. Please note that Section 10.0 of this report recommends additional laboratory analyses of the samples previously taken to further characterize whether or not these samples would be considered hazardous. If you have any questions concerning our findings or recommendations, please contact us. We will proceed at your direction.

Sincerely,

DAMES & MOORE A Limited Professional Partnership

Joe David Kuebler, P.E. Project Manager

Richard U. Edgehill Project Engineer

#### REPORT

#### SUPPLEMENTAL SITE INVESTIGATIONS 4359 STATE STREET ONTARIO, CALIFORNIA

#### 1.0 INTRODUCTION

In accordance with the agreement between the Bank of America and Dames & Moore dated May 6, 1987, a supplemental site investigation was conducted on the property located at 4359 State Street in Ontario, California. The property, located in an industrial/commercial area within San Bernardino County, has been vacated.

#### 2.0 SCOPE OF WORK

The purpose of our supplemental investigation was to evaluate the presence of potentially hazardous materials at the site. The scope of this assessment included the following tasks:

- Review of plot plans and construction drawings of pipelines, sumps, and process equipment.
- Evaluation of whether the underground tank has been properly registered with regulatory authorities.
- Sampling of certain drums and sumps on site and performance of chemical analyses by a DHS-certified laboratory.
- Sampling of an onsite electrical transformer for assessment of polychlorinated biphenyl (PCB) content.
- \* Inspection of the hydraulic car lift in Building Six.
- Preparation of a summary report including recommendations for further action.

-1-

#### 3.0 PLOT PLAN REVIEW

Dames & Moore has made arrangements with Liddle Patrol (Jim Liddle) and Bank of America (Jim Ochsner) to obtain the drawings found in the main office building on June 7, 1987 at the site. It is not known at present whether these materials describe any of the processes utilized at the facility or would be of relevance in an evaluation of potential environmental contamination.

#### 4.0 UNDERGROUND STORAGE TANK

The underground tank on the site, which should have been registered between July 1, 1984 and January 1, 1987, was not registered with the State Water Resources Control Board (Betty Morino, Information Officer, State Water Resources Control Board, Sacramento, California). The tank is also not registered with the San Bernardino County Environmental Health Department (Necie Davis for Jim Smith).

#### 5.0 ELECTRICAL TRANSFORMER

The transformer on the site apparently belongs to Southern California Edison Co. (SCE). Ownership is presently being confirmed by SCE (SCE Ontario Service Center - Rich Dubois). All SCE transformers in the City of Ontario have been verified to contain less than 50 ppm PCB (Rich Dubois).

#### 6.0 HYDRAULIC CAR LIFT

The hydraulic car lift in Building Six was raised for visual observation of subsurface leakage of hydraulic fluid. After raising the car hoist approximately 5 feet there was no evidence of oil on the cylinder. There was no evidence of oil on the surface around the cylinder during its descent. No cracks or holes in the cylinder or concrete were observed.

#### 7.0 SAMPLING PROTOCOL

All sampling activities were performed by Robert Ingersoll and Richard Edgehill of Dames & Moore on June 7 and 8, 1987. Due to the unknown chemistry of the samples, fresh air equipment and special protective clothing (Level B protection) were employed. A total of 26 drums, out of 33 investigated, was sampled. Two sumps were also sampled. Five drums were empty and two drums could not be opened. Drum No. 33 is the Dames & Moore decontamination rinse drum.

-2-

An additional sump was noticed in Building 3 which was not observed during site surveillance activities on April 6, 1987. The sump liquid level was too far below grade to be sampled by conventional means.

A polyvinyl chloride (PVC) core sampler (Coliwasa) was used to sample each drum. The drums were opened using a sparkless bung wrench. The rubber stopper at the end of the sampler was unplugged and the sampler was slowly immersed into the drum through the bung opening. The Coliwasa was removed from the drum after pulling the rubber plug back into its closed position. It was sometimes difficult to obtain a core liquid sample to the true height of the drum and therefore more than one aliquot was usually composited to provide enough sample for analysis.

The Coliwasa was decontaminated between samplings using a wash rinse sequence of liquinox tap water solution, deionized water, methanol, and deionized water. The sampler was immersed into the decontamination solutions and the outside was brushed. It was not always possible to completely remove all of the sampled material from inside the sampler tube.

The collected samples were placed in wide mouth sample jars, iced, and transported by Dames & Moore to Chemical Research Laboratories, 11631 Seaboard Circle in Stanton, California for analysis. The samples were analyzed for pH and ignitability and are currently being held by the laboratory for possible further analysis.

In addition to sampling each drum for chemical analysis, an effort was made to correlate laboratory results with field observations of sample appearance and legible markings on the drums. The size and condition of the drums were also recorded.

#### 8.0 FIELD OBSERVATIONS AND LABORATORY RESULTS

The results of the field observations and laboratory analyses are indicated in Table 1. Four of the drums (#21, 23, 31, 32) had pH values that were less than 2 and thus are considered as corrosive hazardous wastes (Title 22 California Administrative Code). One of these four drums (#23) was labeled

-3-

muriatic acid and was fuming when sampled. It is possible that drum #21 was used as an acid rinsate vessel because it had no top and was sealed with a metal plate. Drum # 6 is an ignitable hazardous waste because it has a flash point of less than 140°F (Title 22 California Adminstrative Code).

Of the 28 samples (26 drums and 2 sumps), 5 are considered to be hazardous as described above. Of the remaining 23, eight drums are labeled as oil (1, 2, 4, 7, 8, 9, 26, and 30) and seven had an oily appearance with a pH value between 6 and 7 (3, 5, 20, 24, 25, 29, Building 2 sump). The remaining eight samples are noncorrosive and nonignitable and can be described as aqueous or had low pH values (14, 15, 16, 18, 19, 26, 28, 33 (decon.)).

#### 9.0 STACKED DRUM AREA SURVEILLANCE

The area south of Building 3 which was found to contain 62 55-gallon drums on April 6, 1987 by Dames & Moore was entered again on June 8, 1987. Portable (limited time) fresh air equipment was employed during the surveillance. At least 3 of the accessible drums (not stacked) were partially filled with unknown liquid. It is not known how many of the remaining 59 drums contain liquid. As stated in our May 6, 1987 letter, sampling of these drums was not included in the scope of work for this site investigation.

#### 10.0 CONCLUSIONS AND RECOMMENDATIONS

The following conclusions and recommendations are noted regarding the Ontario site:

1. Mr. Jim Oshner was contacted regarding previous occupants and the existence of plot plans or drawings for this site. There were no contacts or information readily available. There were some drawings noticed on site during the field investigation. This information will be forwarded by security personnel (Jim Liddle - Liddle Patrol) to Dames & Moore. An addendum report will be submitted if this information is of value to our investigation.

-4-

- 2. The underground tank has not been registered with the appropriate agencies. The Bank of America should decide whether this tank should remain in place. If so, the tank should be filled, leak tested, and registered. If not, the tank should be removed and the surrounding soil sampled and analyzed for possible contamination. Dames & Moore can perform the appropriate task.
- The drums in and near Buildings 2, 3, and 4 and two sumps have been 3. sampled. Five drums have been found to be corrosive or ignitable and are classified as hazardous waste. At Bank of America's direction, Dames & Moore will investigate the disposal options for this hazardous waste. Fifteen drums and two sumps apparently contain oil of one type or another, based on pH results or visual inspection. It is possible that these may be composited in a vacuum truck and taken to a waste oil recycling facility providing they are not contaminated with PCBs To ascertain the chemical quality of this material we or solvents. recommend that the laboratory composite as a single sample and analyze for certain chemical parameters. The remaining drums apparently contain an aqueous-oil mixture. The laboratory should also composite these samples and analyze for certain chemical parameters. It is possible that these drums might also be deposited into a recycling facility. Dames & Moore will coordinate these sampling activities as follow on work.

As an additional task, Dames & Moore will secure the services of a qualified subcontractor to open and sample Drum Nos. 17 and 27, which could not be opened for sampling during this investigation.

4. A safe sampling methodology should be developed for the third sump which was not accessible to sampling during this site investigation. Dames & Moore will develop this methodlogy as follow on work.

-5-

- 5. The electrical transformer more than likely belongs to SCE (Rich Dubois). If the transformer belongs to SCE it has already been sampled and contains less than 50 ppm PCB (Rich Dubois). If SCE does not own the transformer, Dames & Moore will recommend a course of action for Bank of America.
- 6. The hydraulic car lift showed no evidence of oil leakage. No further action is required.
- 7. The 62 55-gallon drums behind Building 3 should be removed from the area with a crane and placed on an adjacent concrete pad. Dames & Moore will, as follow on work, secure the services of a qualified subcontractor to relocate the drums for proper sampling. The drums should then be sampled employing a similar protocol to that described above for other drums on the site.
- 8. Soil sampling activities will be deferred until further laboratory results are obtained regarding constitutents in the drums located on site.

#### LABORATORY REPORT

Samples Received: Three (3) soil samples Date Received: 5-11-88 Purchase Order No: Proj: 05733-055-042/Bank of America

The samples were analyzed as follows:

| Samples Analyzed Analy |
|------------------------|
|------------------------|

| Two soils | Fuel Hydrocarbons by<br>modified EPA 8015<br>(Luft manual 1987, P.60) | Table I |
|-----------|-----------------------------------------------------------------------|---------|

DAMES & MOORE 3 Corporate Park, Suite 100 Irvine, CA 92714

Attn: Cameron Toyne

JOB NO. 10613

#### LABORATORY REPORT

Samples Received: Ten (10) soil samples Date Received: 8-23-88 Date Released for Analysis: 8-24-88 Purchase Order No: Proj#: 02733-059-038/Bank of America

The samples were analyzed as follows:

| Samples Analyzed | <u>Analysis</u>                                                      | <u>Results</u> |
|------------------|----------------------------------------------------------------------|----------------|
| Two (2) soils    | Volatile Organics by<br>EPA 8240                                     | Data Sheets    |
| Two (2) soils    | Fuel Hydrocarbons by<br>modified EPA 8015<br>(LUFT Manual, May 1988) | Table I        |
| Seven (7) soils  | Total Petroleum Hydrocarbons<br>by EPA 418.1                         | Table II       |

#### Data Reporting Qualifiers

- Value If the result is a value greater than or equal to the Detection Limit (DL), the value is reported.
- ND Indicates that the compound was analyzed for but not detected. The minimum DL for the sample with the ND is reported based on necessary concentration or dilution actions.
- TR Indicates an estimated value. This flag is used when the mass spectral data indicates the presence of a compound that meets the identification criteria but the result is less than the specified DL but greater than zero.

#### Data Reporting Qualifiers

- Value If the result is a value greater than or equal to the Detection Limit (DL), the value is reported.
- ND Indicates that the compound was analyzed for but not detected. The minimum DL for the sample with the ND is reported based on necessary concentration or dilution actions.
- TR Indicates an estimated value. This flag is used when the mass spectral data indicates the presence of a compound that meets the identification criteria but the result is less than the specified DL but greater than zero.

### Data Reporting Qualifiers

- Value If the result is a value greater than or equal to the Detection Limit (DL), the value is reported.
- ND Indicates that the compound was analyzed for but not detected. The minimum DL for the sample with the ND is reported based on necessary concentration or dilution actions.
- TR Indicates an estimated value. This flag is used when the mass spectral data indicates the presence of a compound that meets the identification criteria but the result is less than the specified DL but greater than zero.

DAMES & MOORE 1410 3rd Street, Suite 12 Riverside, CA 92507

Attn: John Krueger

JOB NO. 12523

# WEST COAST ANALYTICAL SERVICE, INC.

A

LABORATORY REPORT

 Samples Received: One (1) liquid in triplicate and one (1) trip

 blank

 Date Received: 4-24-89

 Purchase Order No: Proj#: 17761-005-128/BA

 The samples were analyzed as follows:

 Samples Analyzed
 Analysis

 Results

 One (1) liquid
 Volatile Organics

 by EPA 624
 Data Sheets

One (1) liquid Total Petroleum Hydrocarbons by EPA 418.1 Table I

RUDY'S SERVICE STATION MAINTANENCE, INC. 4359 State Street Ontario, California 92376

For The Property Located AT

4359 State Street Ontario, California 92376

April 26, 1990

April 26, 1990

Mr. Ronald A. Ripley, R.S. Environmental Health Specialist Department of Environmental Health County of San Bernardino 385 North Arrowhead Avenue San Bernardino, CA 92415

RE: FINAL SITE CLOSURE REPORT FOR THE PROPERTY LOCATED AT 4359 STATE STREET, ONTARIO, CALIFORNIA.

As of this date all remediation work has been completed, with the exception of the disposal of the contaminated soil, at the property located 4359 State Street, Ontario, California. The work was completed in accordance with the approved site remediation plan submitted on February 14, 1990.

ISULTANTS

BUILDING 2, MACHINE PIT AREA.

Soils were removed to a depth of 23 feet in the machine pit. The soils removed from the pit were stock piled in a separate area for removal at a later date. Samples were taken from 4 separate areas of the pit on April 9, 1990 by Chemical Consultants. The results of that testing can be found in Chemical Consultants report dated April 13, 1990, Log Number SW-1288, see appendix.

BUILDING 3, MACHINE PIT AREA.

Soils were removed to a depth of 10 feet in the machine pit. One sample was taken from the north end of the pit on April 18, 1990 by the geologists Steve Stankov. The results of that test can be found in Chemical Consultants report dated April 13, 1990, Log Number SW-1287 see appendix. The test results indicated high TPH values, 44,000 mg/kg. Based on this concentration an additional 5 feet of soil was removed and an additional sample was taken at approximately 15 feet. The results of this sample indicated a TPH concentration of 26 mg/kg. The results of that test can be found in Chemical Consultants report dated April 18, 1990, Log Number SW-1339 see appendix.

#### SOIL DISPOSAL

The stock pile of contaminated soil was divided into four quadrants with four samples from each quadrant composited into one sample for analysis. The results of this testing can be found in Chemical Consultants reports dated 4/9/90, Log Numbers SW-1289, SW-1290, SW-1290 and SW-1291.

Page 2 of 2 Rudy's Service Station Maintenance Inc. April 26, 1990

At the present time Rudy's Service Station Equipment Maintenance., Inc. is planning to dispose of the contaminated soils at Brent Petroleum Corp., Wilmington CA. All disposal records will be furnished by Rudy's Service Station Equipment Maintenance after disposal has been completed.

Attached to this report is the Geologist Final Report dated April 20, 1990 for your review and approval. If there are any additional questions please contact Chemical Consultants at 714-595-7473.

Sincerely

Jelan MA

# APPENDIX I GEOLOGISTS REPORT

April 20, 1990

Mr. Ronald A. Ripley, R.S. Environmental Health Specialist, Department of Environmental Health County of San Bernardino 385 North Arrowhead Avenue, San Bernardino, CA 92415

Subject: Closure Report-Completed Remediation at Facility, 4359 State Street, Ontario, California.

REFERENCES: "Findings of a Supplemental Soils Investigation Conducted at 4359 State Street, Ontario, CA. December 20, 1989" and "Addendum Report-Findings of a Supplemental Soils Investigation at 4359 State Street, Ontario, CA. January 6, 1990.

Dear Mr. Ripley:

Pursuant to your approved remediation plan for this site, we are pleased to submit this report of completion of the cleanup at the above named facility. This remediation was done by excavation and removal of the contaminated subsurface soil from two locations at this site. A volume of soil, estimated to be more than five hundred cubic yards "in-place", was removed and taken to an authorized disposal treatment facility from beneath two demolished machine pits in Building 2 and Building 3.

The remediation work was carried out in March and April, 1990, in accordance with the results of our site characterization investigations conducted in December, 1989. The work is reported in the references cited above.

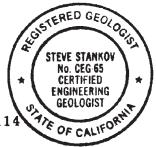

The reports proposed and outlined areas for removal of materials from: (1) near the southwest corner of the fabrication building designated as Building 3, and (2) in the fabrication building designated as Building 2. The soil excavation and the removal work was carried out by our client. The final sampling for compliance was carried out by Chemical Consultants staff. The investigated areas are now cleaned of hydrocarbon contaminants. Two plot plans and a cross section are included with this letter-report to show the location of the areas remediated by excavation and removal. After your observing the sampling and your approval of the results of the final testing, these areas were immediately back filled with clean, washed gravel. This was done to preserve the integrity of the buildings' foundation.

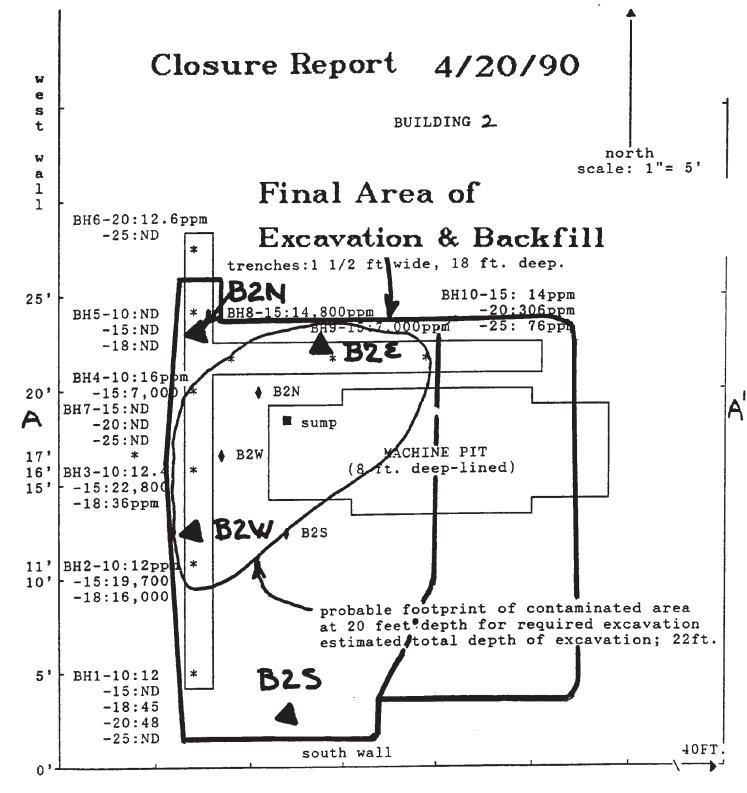

Final results of soil taken from the cleaned out areas show the total hydrocarbon content to be within acceptable limits for this site. The samples chain-of-custody and the certified test results are included. The materials manifest are included under separate cover. Should questions arise regarding this report or this project, please contact me or Chemical Consultants, Inc.

Sincerely,

SSTA

Steve Stankov Registered Geologist 00114

TYPE MATERIAL TESTED: (1) Soil sample taken at 4359 State Street, Ontario, CA from Building 3 Pit on 04/09/90 by Chemical Consultants.

REASON FOR TEST: Determine concentration of constituents listed below for customer's information.

RESULTS:

83

| TOTAL PETROLEUM HYDROCARBONS | 44,000 | mg∕kg |
|------------------------------|--------|-------|
|------------------------------|--------|-------|

#### AROMATIC VOLATILE ORGANICS

| BENZENE             | 5.4 ug/kg                |
|---------------------|--------------------------|
| TOLUENE             | 18 ug/kg                 |
| CHLOROBENZENE       | ND < 5.0 ug/kg           |
| ETHYLBENZENE        | ND < 5.0 $ug/kg$         |

TYPE MATERIAL TESTED: (1) Soil sample taken at 4359 State Street, Ontario, CA from Building 3 Bottom Pit 15' depth on 04/13/90 by Chemical Consultants.

**REASON FOR TEST:** Determine concentration of constituents listed below for customer's information.

**RESULTS:** 

Building 3

TOTAL PETROLEUM HYDROCARBONS

12 mg/kg

TEST METHODS: Total Petroleum Hydrocarbons---- EPA Method 418.1.

Respectfully Submitted,

part. Chemical Consultants

TYPE MATERIAL TESTED: (1) Soil sample taken at 4359 State Street, Ontario, CA from Building 3 Bottom Pit 15' depth on 04/18/90 by Chemical Consultants.

REASON FOR TEST: Determine concentration of constituents listed below for customer's information.

RESULTS:

<u>B 3 - 15X</u>

TOTAL PETROLEUM HYDROCARBONS

26 mg/kg

TEST METHODS: Total Petroleum Hydrocarbons---- EPA Method 418.1.

Respectfully Submitted,

00 20 Chemital Consultants

TYPE MATERIAL TESTED: (4) Soil samples, composited into one sample, taken at 4359 State Street, Ontario, CA from South Stock Pile on 04/09/90 by Chemical Consultants.

**REASON FOR TEST:** Determine concentration of constituents listed below for customer's information.

#### **RESULTS:**

SOUTH STOCK PILE

TOTAL PETROLEUM HYDROCARBONS 8,250 mg/kg

#### AROMATIC VOLATILE ORGANICS

| BENZENE             | ND | < 5.  | ) ug∕kg |
|---------------------|----|-------|---------|
| TOLUENE             |    | 94    | ug/kg   |
| CHLOROBENZENE       | ND | < 5.  | 0 ug/kg |
| ETHYLBENZENE        | ND | < 5.0 | ) ug/kg |
| TOTAL XYLENES       | ND | < 5.  | 0 ug/kg |
| 1,3-DICHLOROBENZENE |    | **    | ug/kg   |
| 1,4-DICHLOROBENZENE |    | **    | ug/kg   |
| 1,2-DICHLOROBENZENE |    | **    | ug/kg   |
